

MySQL

Dorothy Guirgues

SELECT Statement

➤ Used to select data from a database.

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name;
```

```
SELECT * FROM table_name;
```

SELECT Statement (Cont.)

□ Example

```
SELECT CustomerName, City, Country  
FROM Customers;
```

```
SELECT * FROM Customers;
```

SELECT DISTINCT Statement

- Used to return only distinct (different) values.

□ Syntax

SELECT DISTINCT *column1, column2*
FROM *table_name*;

□ Example

SELECT DISTINCT Country FROM Customers;

WHERE Clause

- Used to filter records.
- It is used to extract only those records that fulfill a specified condition

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
WHERE condition;
```

WHERE Clause (Cont.)

□ Example

```
SELECT * FROM Customers  
WHERE Country = 'Mexico';
```

Operators in WHERE Clause

- = Equal
- > Greater than
- < Less than
- >= Greater than or equal
- <= Less than or equal
- <> (!=) Not equal
- Like (Search for a pattern)
- IN (To specify multiple possible values for a column)
- Between (Between a certain range)

AND Operators

- Displays a record if all the conditions separated by AND are TRUE.

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
WHERE condition1 AND condition2 AND condition3 ...;
```

AND Operators (Cont.)

□ Example

```
SELECT * FROM Customers  
WHERE Country = 'Germany' AND City  
= 'Berlin';
```

OR Operators

- Displays a record if any of the conditions separated by OR is TRUE.

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
WHERE condition1 OR condition2 OR c  
ondition3 ...;
```

OR Operators (Cont.)

□ Example

```
SELECT * FROM Customers  
WHERE City = 'Berlin' OR City  
= 'Stuttgart';
```

```
SELECT * FROM Customers  
WHERE Country  
= 'Germany' OR Country  
= 'Spain';
```

NOT Operators

- Displays a record if the condition(s) is NOT TRUE.

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
WHERE NOT condition;
```

NOT Operators (Cont.)

□ Example

SELECT * FROM Customers

WHERE NOT Country = 'Germany';

Combining AND, OR and NOT

❑ Example

```
SELECT * FROM Customers  
WHERE Country  
= 'Germany' AND (City  
= 'Berlin' OR City = 'Stuttgart');
```

```
SELECT * FROM Customers  
WHERE NOT Country  
= 'Germany' AND NOT Country  
= 'USA';
```

LIKE Operator

- The LIKE operator is used in a WHERE clause to search for a specified pattern in a column.

LIKE Operator (Cont.)

- There are two wildcards often used in conjunction with the LIKE operator:
 - The percent sign (%) represents zero, one, or multiple characters
 - The underscore sign (_) represents one, single character
- The percent sign and the underscore can also be used in combinations

LIKE Operator (Cont.)

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
WHERE columnN LIKE pattern;
```

Note: You can also combine any number of conditions using AND or OR operators.

LIKE Operator (Cont.)

LIKE Operator	Description
WHERE Cust_N LIKE 'a%'	Finds any values that start with "a"
WHERE Cust_N LIKE '%a'	Finds any values that end with "a"
WHERE Cust_N LIKE '%or%'	Finds any values that have "or" in any position
WHERE Cust_N LIKE '_r%'	Finds any values that have "r" in the second position
WHERE Cust_N LIKE 'a_%'	Finds any values that start with "a" and are at least 2 characters in length
WHERE Cust_N LIKE 'a__%'	Finds any values that start with "a" and are at least 3 characters in length
WHERE Cust_N LIKE 'a%o'	Finds any values that start with "a" and ends with "o"

LIKE Operator (Cont.)

□ Example

```
SELECT * FROM Customers  
WHERE CustomerName LIKE 'a%';
```

```
SELECT * FROM Customers  
WHERE CustomerName LIKE '%or%';
```

IN Operator

- The IN operator allows you to specify multiple values in a WHERE clause.
- The IN operator is a shorthand for multiple OR conditions.

IN Operator (Cont.)

□ Syntax

```
SELECT column_name(s)
FROM table_name
WHERE column_name IN (value1, value2, ...);
```

OR

```
SELECT column_name(s)
FROM table_name
WHERE column_name IN (SELECT STATEMENT);
```

IN Operator (Cont.)

□ Examples

- Selects all customers that are located in "Germany", "France" or "UK"

```
SELECT * FROM Customers  
WHERE Country IN ('Germany', 'France', 'UK');
```

IN Operator (Cont.)

□ Examples

- Selects all customers that are NOT located in "Germany", "France" or "UK"

```
SELECT * FROM Customers  
WHERE Country  
NOT IN ('Germany', 'France', 'UK');
```

IN Operator (Cont.)

□ Examples

- Selects all customers that are from the same countries as the suppliers

```
SELECT * FROM Customers  
WHERE Country IN (SELECT Country F  
ROM Suppliers);
```

BETWEEN Operator

- The BETWEEN operator selects values within a given range. The values can be numbers, text, or dates.
- The BETWEEN operator is inclusive: begin and end values are included.

BETWEEN Operator (Cont.)

□ Syntax

```
SELECT column_name(s)  
FROM table_name  
WHERE column_name BETWEEN value  
1 AND value2;
```

□ Example

```
SELECT * FROM Products  
WHERE Price BETWEEN 10 AND 20;
```

NOT BETWEEN Operator

□ Examples

SELECT * FROM Products

WHERE Price NOT BETWEEN 10 AND 20;

BETWEEN with IN

□ Examples

SELECT * FROM Products

WHERE Price BETWEEN 10 AND 20

AND CategoryID NOT IN (1,2,3);

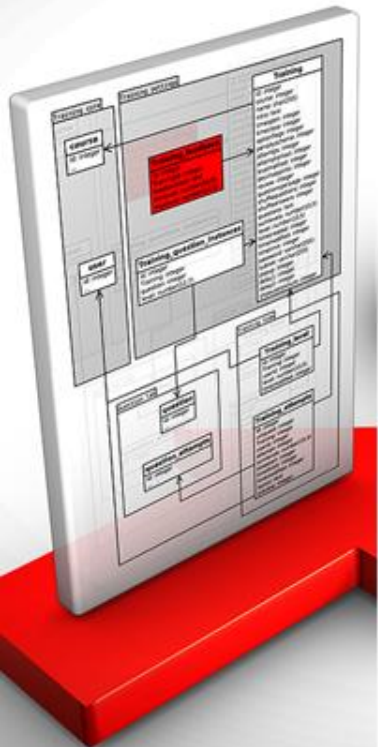

Arithmetic Operators

➤ Arithmetic Operators:

(+, -, *, /, %)

➤ Order of precedence: * , / , +, -

➤ You can enforce priority by adding parentheses

ORDER BY Keyword

- Used to sort the result-set in ascending or descending order.
- Sorts the records in ascending order by default. To sort the records in descending order, use the DESC keyword.

ORDER BY Keyword (Cont.)

□ Syntax

```
SELECT column1, column2, ...  
FROM table_name  
ORDER BY column1, column2,  
... ASC|DESC;
```

□ Example

```
SELECT * FROM Customers  
ORDER BY Country;
```

ORDER BY Keyword (Cont.)

❑ Example

```
SELECT * FROM Customers  
ORDER BY Country DESC;
```

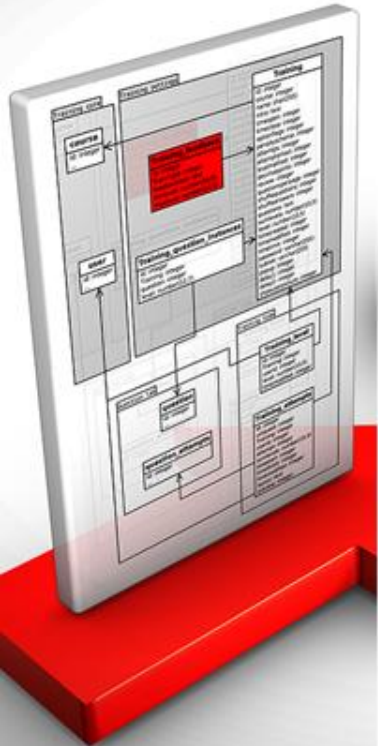

```
SELECT * FROM Customers  
ORDER BY Country, CustomerName;
```

```
SELECT * FROM Customers  
ORDER BY Country ASC,  
CustomerName DESC;
```

Aggregate Functions

➤ COUNT , SUM , MAX, MIN, AVG.

COUNT() Function

- The COUNT() function returns the number of rows that matches a specified criterion.

□ Syntax

```
SELECT COUNT(column_name)  
FROM table_name  
WHERE condition;
```

COUNT() Function (Cont.)

❑ Example

```
SELECT COUNT(ProductID)  
FROM Products;
```

Note: NULL values are not counted.

SUM() Function

- The SUM() function returns the total sum of a numeric column.

□ Syntax

```
SELECT SUM(column_name)  
FROM table_name  
WHERE condition;
```

SUM() Function (Cont.)

❑ Example

```
SELECT SUM(Quantity)  
FROM OrderDetails;
```

Note: NULL values are ignored.

AVG() Function

- The AVG() function returns the average value of a numeric column.

□ Syntax

```
SELECT AVG(column_name)  
FROM table_name  
WHERE condition;
```

AVG() Function (Cont.)

❑ Example

```
SELECT AVG(Price)  
FROM Products;
```

Note: NULL values are ignored.

MIN() and MAX() Functions

- The MIN() function returns the smallest value of the selected column.
- The MAX() function returns the largest value of the selected column.

MIN() and MAX() Functions (Cont.)

□ Syntax

```
SELECT MIN(column_name)  
FROM table_name  
WHERE condition;
```

```
SELECT MAX(column_name)  
FROM table_name  
WHERE condition;
```

MIN() and MAX() Functions (Cont.)

❑ Example

```
SELECT MIN(Price)  
FROM Products;
```

```
SELECT MAX(Price)  
FROM Products;
```

GROUP BY Statement

- The GROUP BY statement groups rows that have the same values into summary rows, like "find the number of customers in each country".
- The GROUP BY statement is often used with aggregate functions (COUNT(), MAX(), MIN(), SUM(), AVG()) to group the result-set by one or more columns.

GROUP BY (Cont.)

□ Syntax

```
SELECT column_name(s)
FROM table_name
WHERE condition
GROUP BY column_name(s)
ORDER BY column_name(s);
```

□ Example

```
SELECT COUNT(CustomerID), Country
FROM Customers
GROUP BY Country;
```

HAVING Clause

- The HAVING clause was added to SQL because the WHERE keyword cannot be used with aggregate functions.

HAVING (Cont.)

□ Syntax

```
SELECT column_name(s)
FROM table_name
WHERE condition
GROUP BY column_name(s)
HAVING condition
ORDER BY column_name(s);
```

□ Example

```
SELECT COUNT(CustomerID), Country
FROM Customers GROUP BY Country
HAVING COUNT(CustomerID) > 5;
```

LIMIT Clause

- Used to specify the number of records to return.

□ Syntax

```
SELECT column_name(s)  
FROM table_name  
WHERE condition  
LIMIT number;
```

LIMIT Clause (Cont.)

□ Example

```
SELECT * FROM Customers  
LIMIT 3;
```

```
SELECT * FROM Customers  
WHERE Country='Germany'  
LIMIT 3;
```

UNION Operator

- Is used to combine the result-set of two or more SELECT statements.
- Every SELECT statement within UNION must have the same number of columns
- The columns must have similar data types
- The columns in every SELECT statement must be in the same order.

UNION Operator (Cont.)

□ UNION Syntax

```
SELECT column_name(s) FROM table1  
UNION  
SELECT column_name(s) FROM table2  
;
```

□ UNION ALL Syntax

```
SELECT column_name(s) FROM table1  
UNION ALL  
SELECT column_name(s) FROM table2  
;
```

UNION Operator (Cont.)

❑ Example

```
SELECT City FROM Customers  
UNION  
SELECT City FROM Suppliers  
ORDER BY City;
```

```
SELECT City FROM Customers  
UNION ALL  
SELECT City FROM Suppliers  
ORDER BY City;
```

Aliases

- Are used to give a table, or a column in a table, a temporary name.
- Are often used to make column names more readable.
- Only exists for the duration of that query.
- An alias is created with the AS keyword.

Aliases (Cont.)

❑ Alias Column Syntax

*SELECT column_name AS alias_name
FROM table_name;*

❑ Alias Table Syntax

*SELECT column_name(s)
FROM table_name AS alias_name;*

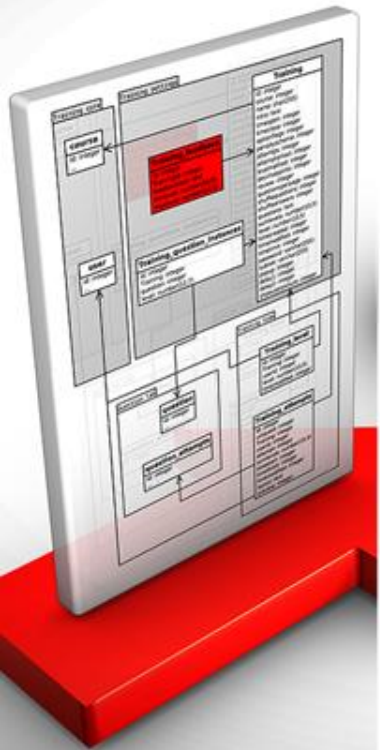

Aliases (Cont.)

□ Examples

```
SELECT CustomerID AS ID,  
       CustomerName AS Customer  
FROM Customers;
```

```
SELECT CustomerName AS Customer,  
       ContactName AS "Contact Person"  
FROM Customers;
```

Note: Single or double quotes are required for space in alias name.

Aliases (Cont.)

□ Examples

```
SELECT CustomerName,  
CONCAT_WS(', ', Address, PostalCode,  
City, Country) AS Address  
FROM Customers;
```

```
SELECT o.OrderID, o.OrderDate,  
c.CustomerName  
FROM Customers AS c, Orders AS o  
WHERE c.CustomerName='Around the  
Horn' AND c.CustomerID=o.CustomerI  
D;
```

Joins

- A JOIN clause is used to combine rows from two or more tables, based on a related column between them.

Joins (Cont.)

➤ Types of Joins:

- **INNER JOIN:** Returns records that have matching values in both tables
- **LEFT JOIN:** Returns all records from the left table, and the matched records from the right table
- **RIGHT JOIN:** Returns all records from the right table, and the matched records from the left table
- **CROSS JOIN:** Returns all records from both tables

Joins (Cont.)

INNER JOIN

LEFT JOIN

RIGHT JOIN

CROSSJOIN

INNER JOIN Keyword

□ Syntax

```
SELECT column_name(s)  
FROM table1 INNER JOIN table2  
ON table1.column_name = table2.colu  
mn_name;
```

□ Example

```
SELECT Orders.OrderID,  
Customers.CustomerName  
FROM Orders INNER JOIN Customers  
ON Orders.CustomerID =  
Customers.CustomerID;
```

LEFT JOIN Keyword

□ Syntax

```
SELECT column_name(s)  
FROM table1 LEFT JOIN table2  
ON table1.column_name = table2.colu  
mn_name;
```

□ Example

```
SELECT Customers.CustomerName,  
Orders.OrderID FROM Customers  
LEFT JOIN Orders ON Customers.CustomerID  
=Orders.CustomerID  
ORDER BY Customers.CustomerName;
```

RIGHT JOIN Keyword

❑ Syntax

```
SELECT column_name(s)  
FROM table1 RIGHT JOIN table2  
ON table1.column_name = table2.colu  
mn_name;
```

❑ Example

```
SELECT Orders.OrderID,  
Employees.FirstName FROM Orders  
RIGHT JOIN Employees ON Orders.EmployeeI  
D = Employees.EmployeeID  
ORDER BY Orders.OrderID;
```

CROSS JOIN Keyword

❑ Syntax

```
SELECT column_name(s)  
FROM table1  
CROSS JOIN table2;
```

❑ Example

```
SELECT Customers.CustomerName,  
Orders.OrderID  
FROM Customers  
CROSS JOIN Orders;
```

SELF JOIN Keyword

- A self join is a regular join, but the table is joined with itself.

□ Syntax

```
SELECT column_name(s)  
FROM table1 T1, table1 T2  
WHERE condition;
```

SELF JOIN Keyword (Cont.)

❑ Example

```
SELECT A.CustomerName AS  
CustomerName1,  
B.CustomerName AS CustomerName2,  
A.City  
FROM Customers A, Customers B  
WHERE A.CustomerID <>  
B.CustomerID  
AND A.City = B.City  
ORDER BY A.City;
```

EXISTS Operator

- The EXISTS operator is used to test for the existence of any record in a subquery.
- The EXISTS operator returns TRUE if the subquery returns one or more records.

EXISTS Operator (Cont.)

□ Syntax

```
SELECT column_name(s)  
FROM table_name  
WHERE EXISTS  
(SELECT column_name FROM table_name  
WHERE condition);
```

□ Example

```
SELECT SupplierName FROM Suppliers  
WHERE EXISTS (SELECT ProductName FROM  
Products WHERE Products.SupplierID =  
Suppliers.supplierID AND Price < 20);
```

INSERT INTO Statement

- Used to insert new records in a table.

□ Syntax

INSERT INTO *table_name*
VALUES (*value1*, *value2*, *value3*, ...);

INSERT INTO *table_name* (*column1*, *column2*, *column3*, ...)
VALUES (*value1*, *value2*, *value3*, ...);

INSERT INTO Statement (Cont.)

❑ Example

```
INSERT INTO Customers  
VALUES ('Cardinal', 'Tom B.  
Erichsen', 'Skagen  
21', 'Stavanger', '4006', 'Norway');
```

```
INSERT INTO Customers  
(CustomerName, City, Country)  
VALUES ('Cardinal', 'Stavanger', 'Norw  
ay');
```

NULL Value

- A field with a NULL value is a field with no value.
- It is not possible to test for NULL values with comparison operators, such as =, <, or <>.
- We will have to use the IS NULL and IS NOT NULL operators instead.

NULL Value (Cont.)

□ Syntax

```
SELECT column_names  
FROM table_name  
WHERE column_name IS NULL;
```

```
SELECT column_names  
FROM table_name  
WHERE column_name IS NOT NULL;
```

The diagram illustrates a training system architecture, organized into three main vertical sections: **Training Site**, **Training Process**, and **Training**.

- Training Site:**
 - Learners:** 10 people
 - Staff:** 1 person
- Training Process:**
 - Training Questions Database:** A central database containing training questions.
 - Training Questions Database (Red Box):** A highlighted version of the database, likely representing a specific state or a key component.
- Training:**
 - Training Activities:** A list of activities including:
 - 1. Training
 - 2. Training
 - 3. Training
 - 4. Training
 - 5. Training
 - 6. Training
 - 7. Training
 - 8. Training
 - 9. Training

Arrows indicate the flow of information and processes between these components, showing a structured and interconnected system.

□ Example

```
SELECT CustomerName, ContactName,  
Address  
FROM Customers  
WHERE Address IS NULL;
```

```
SELECT CustomerName, ContactName,  
Address  
FROM Customers  
WHERE Address IS NOT NULL;
```

UPDATE Statement

- Used to modify the existing records in a table.

□ Syntax

*UPDATE table_name
SET column1 = value1, column2 = value2, ...
WHERE condition;*

UPDATE Statement (Cont.)

❑ Example

```
UPDATE Customers  
SET PostalCode = 00000  
WHERE Country = 'Mexico';
```

```
UPDATE Customers  
SET PostalCode = 00000;
```

```
UPDATE Customers  
SET ContactName = 'Alfred Schmidt', City  
= 'Frankfurt'  
WHERE CustomerID = 1;
```

DELETE Statement

- Used to delete existing records in a table.

□ Syntax

DELETE FROM *table_name* WHERE *condition*;

DELETE FROM *table_name*;

DELETE Statement (Cont.)

❑ Example

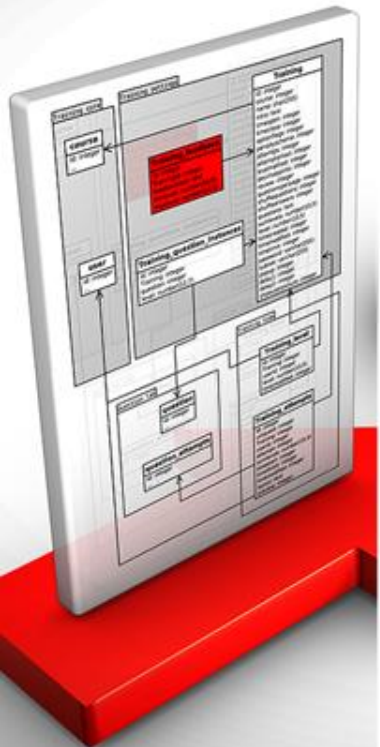

```
DELETE FROM Customers WHERE CustomerName='Alfreds Futterkiste';
```

```
DELETE FROM Customers;
```

Comments

- Comments are used to explain sections of SQL statements, or to prevent execution of SQL statements.
- Single line comments start with `--`.
- Multi-line comments start with `/*` and end with `*/`

Comments (Cont.)

❑ Example

```
-- SELECT * FROM Customers;  
SELECT * FROM Products;
```

```
SELECT * FROM Customers -- WHERE  
City='Berlin';
```

```
/*Select all the columns of all the records  
in the Customers table:*/
```

```
SELECT * FROM Customers;
```

```
SELECT CustomerName, /*City,*/ Country FR  
OM Customers;
```

Any Questions?

Thank you
